:has()

```
.items:has(p) {  
  border-color: orange;  
}
```

If each items contain a paragraph, Change the border color.

The image shows a laptop screen with three distinct UI components. On the left is a blue rectangular button with the text 'Button' in white. In the center is a blue rectangular box containing a colorful, abstract, glowing image. On the right is a rectangular box with an orange border and a white background, containing the text 'Animated contents are easy to learn.' in black.

:has(), à connaître pour pas être naze

I don't know if you've noticed, but the CSS world has been on fire recently. 🔥

Behind the scenes, all major browser vendors and the CSS specification authors have been working together to deliver *tons* of highly-requested CSS features. Things like container queries, native CSS nesting, relative color syntax, balanced text, and so much more.

One of these new features is the `:has` pseudo-class. And, honestly, I wasn't sure how useful it would be for me. I mostly build webapps using React, which means I tend not to use complex selectors. Would the `:has` pseudo-class really offer much benefit in this context?

Well, I've spent the past few months rebuilding this blog, using all of the modern CSS bells and whistles. And my goodness, I was wrong about `:has`. It's an *incredibly* handy utility, even in a CSS-in-JS context!

The missing selector

The best tool for the job

<table> highlighting with CSS :has() 💡

```
td:has(~ td:hover), /* previous sibling cells */
table:has(td:nth-of-type(3):hover) /* column cells */
tr:not(:first-of-type):has(- tr:hover)
td:nth-of-type(3) {
  background: var(--highlighted);
}
```

Text Wrap : Pretty balance ?

<https://alexpate.com/posts/future-css-text-wrap-pretty>

This is my headline text

And this is my subheading text which is a little bit
longer

Text Wrap : ça balance !

<https://alexpate.com/posts/future-css-text-wrap-pretty>

```
.subheading {  
  text-wrap: balance;  
}
```

This is my headline text

And this is my subheading
text which is a little bit longer

Text Wrap : c'est pretty !

<https://alexpate.com/posts/future-css-text-wrap-pretty>

```
.subheading {  
  text-wrap: pretty;  
}
```

This is my headline text

And this is my subheading text which is a little
bit longer
